

# Wildlife of Central Australia

## Vertebrate species of the southern half of the Northern Territory

The vertebrate fauna of the central Australian mountain range system is comparatively rich for an Australian desert region. This richness stems largely from the geological and topographic diversity characteristic of the study region. A field survey of the terrestrial vertebrate fauna of the arid Central Australian Ranges region (116,537 km<sup>2</sup>) in the Northern Territory was conducted over three years as part of the collaborative research project to develop the 'Central Australian Ranges Geographic Information System' (CARGIS). The study sampled the vertebrate fauna across the region's range of major environments at 117 survey sites. Fauna surveys yielded records of 221 terrestrial vertebrate species (213 native, 8 exotic), comprising 109 bird, 34 extant mammal (and old evidence of one extinct mammal), 76 reptile and 1 frog species. These included several species previously unrecorded in the region. This represents over half of the 438 known vertebrate species from the Central Australian Ranges region (421 native, 17 exotic) and 44% of the 502 species (484 native, 18 exotic) known from the southern half of the Northern Territory.

Species nomenclature according to the CSIRO List of Australian Vertebrates (Stanger *et al.* 1998). Status NT is based on the Endangered Species Protection Act 1992 (Schedule 1, 19/01/2000) and national ANZECC (1999) list and amended according to published Action Plans (X = Presumed Extinct; E = Endangered; V = Vulnerable; # = Listed in Action Plans as at risk or poorly known). Species found in southern NT (20-26°S, 129-138°E) and found in the Central Australian Ranges (+) (CAR Area = 23-25°S, 131-136°E). \* denotes species exotic to the NT; ? denotes a species that is either vagrant or edge of range in the southern NT or an unconfirmed record.
